Backing up the RentalPoint Database

Last Modified on 28/08/2026 10:18 am EDT

Please Note: There is a difference between backing up a SQL Server database versus backing up a server.

A backup of the server includes all the individual files and folders on the hard disk(s), which includes all the individual files that make up the SQL Server database.

A backup of an SQL Server database is a single file that contains all the necessary information to recover the entire database. This single file makes data recovery and migration to later releases of SQL Server easier and faster.
